

HARSHDEEP GROUP

Founder Operating System

How to run four brands from one command center — in about an hour a day

Aurra Hype • Designomics India • Loop In Events • Arihant Digital

AI copilots + automations do the rest

The founder's day-to-day playbook

Founder: Harshdeep | Bengaluru, India | July 2026

Contents

1. The Idea

Four brands cannot be run from an inbox and a dozen open tabs. The Founder Operating System is one command center that pulls every number, task, message and approval into a single place, with AI and automations doing the heavy lifting so your time goes to decisions and taste — not data-gathering. The target is to run the whole group in roughly an hour of focused review a day, plus real work on whatever needs your judgment.

It has ten layers. You do not build them all at once — layers 1–4 are Month 1, 5–8 are Month 2, 9–10 are Month 3.

2. The Ten Layers

Layer	What it is	Tools
1 • Command Center	One dashboard: revenue, CAC, ROAS, AOV, cash, stock, pipeline — all four brands	Looker Studio + Triple Whale + Sheets, fed by n8n
2 • Daily Digest	8am summary + anomalies + today's to-dos, pushed to you	n8n + GPT + WhatsApp/Telegram
3 • AI Chief of Staff	Ask questions across all your data in plain language	Claude + MCP connectors (Shopify, ads, CRM, Sheets)
4 • Work System	Every brand's workstreams, tasks and SOPs in one place	Notion / ClickUp
5 • Time & Focus	AI auto-schedules deep work, meetings and priorities	Motion (usemotion) / Reclaim
6 • Meetings	Auto notes + action items pushed to tasks	Fathom / Fireflies
7 • Comms Hub	One inbox for email, IG, WhatsApp and chat	Gorgias / shared inbox + Superhuman
8 • Money View	Spend, burn, runway and approvals across brands	Volopay/Jify + Zoho Books
9 • Approvals	Creative, spend and hires flow to you for one-tap approve	n8n + WhatsApp/Slack
10 • Weekly Scorecard	Auto scorecard vs targets + team accountability	Looker + n8n

3. The Command Center

A single live page is the heart of the system. It shows, for each of the four brands and for the group: revenue today/WTD/MTD vs target; ad spend and blended ROAS; CAC and AOV; contribution margin; orders and RTO rate; cash position and runway; and the B2B pipeline (events + corporate gifting) and Arihant's client pipeline. It is built in Looker Studio, fed by Triple Whale and Google Sheets, which n8n keeps updated from Shopify, the ad platforms and your CRM. You open it first thing and glance — green is fine, red gets your attention.

4. The AI Chief of Staff (Claude + MCP)

Instead of digging through dashboards, you ask. With Claude connected to your systems through MCP (Model Context Protocol), you can type questions like “which Aurra Hype creatives had ROAS above 3 this week and how much budget is left on them?”, “what's my true margin on the top 10 Designomics SKUs after RTO?”, or “draft this week's investor update from the numbers.” MCP is an open 2026 standard with thousands of ready connectors, so Shopify, your ad accounts, HubSpot, Sheets and more plug in. Pair it with no-code agents (Gumloop/Lindy) for recurring jobs — lead qualification, competitor scans, weekly reporting — that run without you.

5. The Founder's Cadence

Daily (about an hour, in blocks)

- Morning: read the 8am digest; open the Command Center; flag anything red. (10 min)
- Approvals: clear the one-tap queue — creative, spend, hires. (10 min)
- Comms: batch-process the unified inbox twice, not continuously. (20 min)
- Deep work: one Motion-scheduled block on the highest-judgment task — product, partnerships, creative direction. (remainder)

Weekly

- Monday: review the auto-scorecard vs targets per brand; set the week's one priority per brand.
- Midweek: creative review (what's winning in Motion), pipeline review (HubSpot).
- Friday: money review (burn/runway), and a 30-minute retro — what to automate next.

Monthly

- Unit-economics deep dive per brand with the CA; update the growth-curve deck from real data.
- Hiring/SOP review; decide what the founder should stop doing and hand to a person or an agent.

6. Founder-Level Automations

Beyond the brand automations, these protect the founder's time and attention specifically:

Automation	What it does
8am command digest	Sales, spend, ROAS, top SKUs, low stock, pipeline changes — one WhatsApp/Telegram message across four brands.
Anomaly alerts	Only pings you when something breaks a threshold (ROAS drop, stockout, RTO spike, big lead) — signal, not noise.
One-tap approvals	Creative, ad-budget and hire requests arrive as approve/reject buttons; your tap triggers the next automated step.
Weekly auto-scorecard	Every Monday, targets vs actuals per brand, with owners — built and delivered automatically.
Meeting-to-tasks	Every call is transcribed; action items land in Notion assigned, so nothing

Automation	What it does
	relies on memory.
AI weekly briefing	Claude drafts a plain-language 'state of the group' from the data for your Monday review.
Cash & runway watch	Flags burn and runway changes and unusually large expenses before they matter.

7. A Day in the Life (target state)

You wake to a single message: revenue tracking to plan, one Aurra Hype creative fatiguing, a corporate-gifting lead worth following up, one low-stock SKU with a PO already drafted for your approval. You approve the PO and the creative swap with two taps. You open the Command Center — all green except Loop In's pipeline, so you spend your deep-work block on event outreach. Your AI chief of staff drafts three follow-ups from the CRM; you edit and send. Meetings auto-transcribe into tasks. By early afternoon the operational surface is handled, and your remaining time goes to the things only you can do — product taste, partnerships, and brand direction. That is the point of the system: leverage, not busywork.

Build order: *Command Center + Daily Digest + AI Chief of Staff + Work System in Month 1; Time/Focus + Meetings + Comms + Money in Month 2; Approvals + Weekly Scorecard in Month 3. Companion: Harshdeep_Group_Master_Stack_FULL.xlsx ("Founder OS" tab).*
